Weather Observation Station 4

Easy

Basic Select

Find the difference between the total number of **CITY** entries in the table and the number of distinct **CITY** entries in the table.

The **STATION** table is described as follows:

STATION

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where **LAT_N** is the northern latitude and **LONG_W** is the western longitude.

For example, if there are three records in the table with **CITY** values 'New York', 'New York', 'Bengalaru', there are 2 different city names: 'New York' and 'Bengalaru'. The query returns , because
Total number of records – number of unique city names = 3 – 2 = 1 .

Query:-

```sql
SELECT (Count(CITY) - Count(Distinct CITY))
FROM STATION;
```

Congratulations!

You have passed the sample test cases. Click the submit button to run your code against all the test cases.
